## 0.1 6.1.16

Show that if  $n$  is a composite integer with  $n \neq 4$ , then  $(n-1)! \equiv 0 \pmod{n}$

If  $n$  is composite, then there two possibilities:

Case 1:

$\exists a, b \in \mathbf{P}$  where  $ab = n$  and  $2 \leq a < b \leq n-2$ .

$(ab-1)! = 1 \cdot 2 \cdot 3 \cdot \dots \cdot a \cdot \dots \cdot b \cdot \dots \cdot (ab-1) \rightarrow ab \mid (ab-1)!$

Case 2:

$\nexists a, b \in \mathbf{P}$  where  $ab = n$  and  $2 \leq a < b \leq n-2 \rightarrow \exists p \in \mathbf{P}$  where  $p^2 = n$ .

Since  $n > p$ ,  $(n-1)! = 1 \cdot 2 \cdot 3 \cdot \dots \cdot p \cdot \dots \cdot (n-1)$ .

$\therefore p \mid (n-1)!$

Since  $n \neq 4$  and all positive squares are greater than 4,  $2p < n$ .

$\therefore (n-1)! = 1 \cdot 2 \cdot 3 \cdot \dots \cdot 2p \cdot \dots \cdot (n-1)$ .

$\therefore 2p \mid (n-1)!$

$2p \mid (n-1)!$  and  $p \mid (n-1)! \rightarrow$

$2p^2 \mid (n-1)! \rightarrow$

$2n \mid (n-1)! \rightarrow$

$n \mid (n-1)!$

$\therefore (n-1)! \equiv 0 \pmod{n}$  for all composites  $n$ ,  $n \neq 4$ .

## 0.2 6.1.22

Show that  $30 \mid (n^9 - n) \quad \forall n \in \mathbb{Z}^+$ .

$2, 3, 5 \mid n(n-1)(n+1)(n^2+1) \rightarrow$

$30 \mid n(n-1)(n+1)(n^2+1) \rightarrow$

$30 \mid n(n-1)(n+1)(n^2+1)(n^4+1) \rightarrow$

$30 \mid (n^9 - n)$ .

We now are left to prove that 2, 3, and 5 divide  $n(n-1)(n+1)(n^2+1)$ .

$n(n-1)$  forms a sequence of two consecutive integers.

Therefore, one of them must divide 2 (this could be trivially shown with an enumeration of possibilities in the form  $2q+r$ ).

$$\therefore 2 \mid n(n-1)(n+1)(n^2+1) \quad \forall n \in \mathbb{Z}^+.$$

$n(n-1)(n+1)$  forms a sequence of three consecutive integers.

We can use the same argument we used to prove divisibility by two.

$$\therefore 3 \mid n(n-1)(n+1)(n^2+1) \quad \forall n \in \mathbb{Z}^+.$$

Suppose 5 does not divide  $k(k-1)(k+1)$ .

$k$  must then be in the form  $5t+2$  or  $5t+3$  for some  $t \in \mathbb{Z}^+$ , as a form of  $5t+0$ ,  $5t+1$ , or  $5t+4$  would result in the product having a term divisible by 5.

If  $k$  is in the form  $5t+2$  or  $5t+3$ , then  $(k^2+1)$  is in the form  $25t+4+1$  or  $25t+9+1$ , both which are divisible by 5.

$$\therefore 5 \mid n(n-1)(n+1)(n^2+1) \quad \forall n \in \mathbb{Z}^+.$$

$$\therefore 30 \mid (n^9 - n) \quad \forall n \in \mathbb{Z}^+.$$

(However, it is worth noting that if  $n < 2$ , then the product is 0)

### 0.3 6.3.4

Show that if  $a, m \in \mathbb{Z}^+$ ,  $(a, m) = (a-1, m) = 1$ , then  $1+a+a^2+\dots+a^{\varphi(m)-1} \equiv 0 \pmod{m}$ .

Let  $x \in \mathbb{Z}$  where  $x = 1 + a + a^2 + \dots + a^{\varphi(m)-1}$

$$ax = a + a^2 + \dots + a^{\varphi(m)-1} + a^{\varphi(m)}$$

$$ax + 1 = 1 + a + a^2 + \dots + a^{\varphi(m)-1} + a^{\varphi(m)}$$

$$ax + 1 = x + a^{\varphi(m)}$$

$$x = \frac{a^{\varphi(m)} - 1}{a - 1}$$

$$1 + a + a^2 + \dots + a^{\varphi(m)-1} \equiv \frac{a^{\varphi(m)} - 1}{a - 1} \pmod{m}$$

$$\frac{a^{\varphi(m)} - 1}{a - 1} \equiv \frac{1 - 1}{a - 1} \equiv 0 \pmod{m}, \text{ by Euler's totient theorem, given } a > 1.$$

$$\therefore 1 + a + a^2 + \dots + a^{\varphi(m)-1} \equiv 0 \pmod{m} \quad \forall a, m \in \mathbb{Z}^+, (a, m) = (a-1, m) = 1.$$

### 0.4 6.3.10

Show that  $a^{\varphi(b)} + b^{\varphi(a)} \equiv 1 \pmod{ab}$  given  $a \perp b$ .

$a^{\varphi(b)} + b^{\varphi(a)} - 1 \equiv b^{\varphi(a)} - 1 \equiv 0 \pmod{a}$  by Euler's totient theorem ( $a \perp b$ ).

Without loss of generality,  $a^{\varphi(b)} + b^{\varphi(a)} - 1 \equiv 0 \pmod{b}$ .

$$\therefore a^{\varphi(b)} + b^{\varphi(a)} - 1 \equiv 0 \pmod{ab}.$$

$$\therefore a^{\varphi(b)} + b^{\varphi(a)} \equiv 1 \pmod{ab} \text{ for all coprime integers } a \text{ and } b.$$
